

GroupTrack V2.4

Release Notes | May 12, 2026

Critical Notices

DO NOT UPDATE T1000-E FIRMWARE

Your T1000-E radio MUST remain on firmware version 2.6.11. Newer firmware versions destabilize BLE connectivity and radio configuration. Do not accept firmware update prompts.

DO NOT REMOVE T1000-E FROM CART

Keep your T1000-E radio in your cart during rides. The radio must stay within 50 feet BLE range of your phone. Exceeding this range causes supervision timeout pauses that disrupt tracking.

What's New in V2.4

This release focuses on map download reliability, background download management, and a redesigned navigation experience between the convoy map and the new Planning Map.

1. Map Download Fix

Fixed a critical bug where the app was downloading Google satellite tiles instead of Esri tiles. The display showed correct Esri imagery, but downloads used wrong URLs. This caused slow downloads and throttling. All 17 hardcoded tile URL references have been replaced with a single data-driven source (MapSourceManager reading map_sources.json). Downloads are now fast and use the correct Esri tile servers.

2. Background Download Queue

Map tile downloads now run in the background. You can close GroupTrack and downloads continue. A notification in your system tray shows progress. Key features:

- Up to 2 simultaneous downloads
- Downloads survive app backgrounding, screen rotation, and device sleep
- Cancel any download from the notification or the queue panel
- Queue panel shows active downloads, queued items, and completed downloads
- Progress notification with Cancel button in the system tray

3. Planning Map (formerly Map Viewer)

The Map Viewer has been renamed to Planning Map and is now the primary tool for downloading map tiles, viewing trail

data, and planning rides. The convoy map now has a PLANNING MAP button for quick access.

3a. Track Management on Planning Map

The Planning Map now includes a TRACKS button in the header bar for quick access to track management. Tap TRACKS to open the track picker where you can select, rename, delete, and manage your recorded ride tracks directly from the planning view.

4. Redesigned Map Toolbar

Both the convoy map and Planning Map now share a consistent toolbar design:

- Fixed source bar at top: SAT / TOPO / TOPO+ tile source selection with NET/LOCAL toggle
- Floating DISPLAY panel: draggable toggle panel for Tracks, Trails, Downloaded Areas, and Downloads in Progress
- Navigation buttons: PLANNING MAP on convoy, CONVOY on Planning Map for quick switching

How to Use the New Features

Downloading Map Tiles

1. From the convoy map, tap PLANNING MAP in the top bar to open the Planning Map.
2. Use the search field at the top to find your area (e.g., "St George UT").
3. Tap the DOWNLOAD button and draw a rectangle around the area you want.
4. Confirm the download. It enters the queue and starts automatically.
5. You can close GroupTrack. The download continues in the background.
6. A notification in your system tray shows progress. Tap Cancel to stop.

Managing the Download Queue

The queue panel appears at the bottom-left of the Planning Map when downloads are active. Tap the summary pill to expand it and see:

- Active downloads with individual progress bars and Cancel buttons
- Queued items waiting to start
- Completed and failed downloads
- CANCEL ALL and CLEAR DONE buttons

Using the Display Panel

The floating DISPLAY panel appears on both maps. Tap the "DISPLAY" pill to expand it. Toggle layers on and off:

- Tracks: show/hide your recorded tracks on the map
- Trails: show/hide trail data (currently Utah St. George area)
- Downloaded Areas: show blue shadow overlay where you have offline tiles
- Downloads in Progress: show pink shadow for areas being downloaded, red for removals
- Waypoints and Routes: coming in V2.5 (greyed out)

The DISPLAY panel is draggable. Hold and drag it to any position on the map to keep it out of your way.

Switching Between Maps

The convoy map is for live ride operations. The Planning Map is for downloading tiles, viewing trails, and planning routes.

From convoy map: tap PLANNING MAP in the top bar.

From Planning Map: tap CONVOY in the top bar to return.

Switching Tile Sources

The top bar on both maps shows SAT / TOPO / TOPO+ buttons. Tap to switch between satellite imagery, topographic maps, and USGS topo maps. The NET/LOCAL toggle switches between online tiles (requires internet) and locally cached tiles (works offline).

Known Issues

- Budget Android devices (Tab8NEU, Android 10/14/16) cannot maintain BLE connection to T1000-E radios. Use tested devices from the compatibility list.
- First download after a fresh install may take a moment to initialize the notification channel.
- The DISPLAY panel position resets when navigating between screens. Position persistence coming in V2.5.

Coming in V2.5 (4-Week Development Cycle)

V2.5 introduces the spatial data engine with on-device trail databases, waypoints, routes, and area management. Key features:

- Waypoints: create, rename, type-select (trailhead, fuel, gate, hazard, etc.), share with riders
- Routes: draw on map, snap to trails, import GPX/KML, assign to rides
- Trail database: download full state trail datasets, filter by OHV/hiking/horse, lazy-load to map
- Area management: remove downloaded tiles, smart download guided by trail coverage
- Data protection: automatic backups, change journal, point-in-time rollback
- Display panel: Waypoints and Routes toggles become active

Support

For issues, feedback, or questions, contact the GroupTrack development team. Visit grouptrack.org for the latest updates and documentation.
