GroupTrack 2.7c — internal testing

26 October 2026 · One Map: one map, every tool, a cleaner screen · with internal testers before release

2.7c replaces the ride map and the planning map with one map. Everything you could do on either map is on it, reached from a few buttons around the edge.

Navigation is organised by what you are doing. Each button opens one job, and the steps of a job sit together behind it — every map task (download, remove, recover maps, import trails and features) under **Map**, everything about rides under **Rides**, building a route under **Add Route**, the radio under **RADIO SETUP**, what shows on the map under **FILTER** and how it is drawn under **MAP KEY**. In earlier versions the same jobs were spread across two maps and several menus. One map with a menu and buttons laid out like the outdoor apps riders already know — Gaia GPS and onX — makes GroupTrack far easier to find your way around: you go to the button for the job, and everything for that job is there.

Two modes, one button. Mode on the map switches between them (not while you are recording):

- **Android only** — one rider, no radio. Your tablet's GPS places your cart; **REC** records your ride, and the readout shows **MY CART**. Everything else — maps, trails, routes, rides, search — works the same.
- **Group** — several riders, each with a mesh radio. **CHK IN** checks you in to the ride with your role, then records; the map shows every cart in the group, **GRP Awareness** shows your radio link, and **View: Group / View: My Cart** (in Add Route's place once you are checked in) switches the readout between the whole group and your own cart.

Rel 2.7c · 26 October 2026

> NEW **One-time update of your Utah trails**
>
> If you imported Utah trails in an earlier version, the first start of 2.7c marks them public or private from Utah's land ownership data — once, in the background, about a minute after the map opens. The Assign Utah private property panel shows its progress; it takes about 10 minutes for the whole state. Keep GroupTrack open; if it is interrupted it starts again next time. An import waits until it has finished. *25 Oct*
>
> **What it means for you:** private land shows as private without you doing anything — earlier versions could leave every Utah trail marked public.

CHANGED **FILTER › LAND — Public and Private, each with its own tick**

The land line in FILTER is now **LAND ☑ Public ☑ Private** (it was one tick, "Include private land"). Untick Public to see only the trails on private land; untick Private to see only public trails. At least one stays ticked. New installs start with Public only. *25 Oct*

What it means for you: you can check exactly which trails cross private land before you ride.

CHANGED **The GPS light says whose GPS it is**

On a tablet with its own GPS the light above CHK IN / REC reads **DROID GPS 7** (the number of satellites) or **NO DROID GPS**; when your position comes from the radio it reads **RADIO GPS** or **NO RADIO GPS**. *25 Oct*

What it means for you: you can tell at a glance whether the tablet or the radio is placing your cart.

FIXED **Help and the release notes are never covered**

An open document (Help, Quick Start, Release Notes) is now the top layer — the readout no longer sits over it. *25 Oct*

CHANGED **Trail imports no longer rebuild your trails from tracks**

Trails from your tracks are made the moment a track is saved or imported, ridden ground counted as motorized and public. Map › Import map features › Create trails from tracks is there for tracks you had before this was automatic. *24 Oct*

What it means for you: trail imports finish sooner, and your trails from tracks are always complete.

CHANGED **Trail imports classify only what they added**

After an import, only the new trails are given their type, use and public / private land — seconds instead of minutes. Assign Utah private property still reassigns every trail when you ask it to. *24 Oct*

What it means for you: an import ends quickly, and nothing you already have is changed by it.

CHANGED **Every screen in one look — its colours follow the map type**

All GroupTrack screens now use one set of colours, chosen by the map you are looking at. Over the **SAT** map (dark imagery) every screen is **white with blue writing**; over the **TOPO** and **TOPO+** maps (light backgrounds) every screen is **blue with white writing** — so panels and buttons always stand out from the map behind them. No writing smaller than 12 point, panels are solid (the map no longer shows through), and a chosen item shows a check mark ✓ in a box. *24 Oct*

What it means for you: every screen reads the same way and stays readable on any map, and you can always tell what is selected.

NEW **The same header on every screen — HELP and ISSUE**

Every screen and panel now has the same title bar: the screen's name, **HELP**, **ISSUE** and **✕** to close. **HELP** opens the user manual at the section for the function you are in — not at the start of the manual. In this test build most screens land on their section and the rest open the manual; every screen lands on its own section before the public release. **ISSUE** reports a problem from where it happens (below). *24–25 Oct*

What it means for you: help for the screen you are looking at is one tap away, and every screen closes the same way.

NEW **ISSUE — report a problem from any screen, with the screen attached**

ISSUE sits beside HELP on every screen. It takes a picture of the screen exactly as it is, lets you add the next screens of the same job, and **SEND** opens your email to support@grouptrack.org with the pictures attached and the GroupTrack version filled in (or Settings › Issue reports keeps them on the tablet to send later). **Please explain the error you are seeing in the email text** — what you were doing, what you expected, and what happened instead. *24 Oct*

What it means for you: a problem reaches us with the exact screens, the version and your words, in a few taps — testers, this is the fastest way to tell us.

CHANGED **Create a ride starts with Search**

Search first positions the map by area, track, route or waypoint; PROCEED TO RIDE CREATION then lists the routes in that part of the map to build the ride from. Turn a track into a route before you go on. *24 Oct*

What it means for you: you find the route you want by where it is, not by scrolling a long list.

NEW **Download settings**

Map › Download settings sets which map sources a download uses and whether it replaces tiles you already have. Every download starts from them and shows them in one line; CHANGE alters that download only. *24 Oct*

What it means for you: set it once — no more choosing sources on every download.

NEW **Assign Utah private property**

Map › Import map features › Assign Utah private property marks which trails are on private land from Utah's land ownership data, downloading the data first if it is not on the tablet (it was Settings › Classify trails again). *24 Oct*

What it means for you: town streets on private land are shown as residential, and the step has one place.

NEW **Import trails by area — you see the list first**

After you draw the box, every state and trail source it touches is listed before anything downloads. A state you already imported whole starts unticked; untick a state the box only clips (a state is chosen by the rectangle around it). The progress screen now scrolls. *24 Oct*

What it means for you: no half-gigabyte downloads for a state you already have, or one your box does not reach.

NEW **Display trail, waypoint counts by state**

Map › Import map features lists your trails (and how many are on private land), your waypoints and map points, and, state by state, what each import added. *24 Oct*

What it means for you: you can see what is on the tablet, and where it came from.

FIXED **GRP Awareness shows its colour again**

The GRP Awareness light is green, red or grey again (it had turned blue), and the Map button's downloading dot is green. *24 Oct*

What it means for you: you can read the group's state at a glance.

NEW **One Map — one set of buttons around one map**

RECORD at the top; MENU and zoom on the left; GRP Awareness, Mode, Status, Map Key, Filter and Centre on Me on the right; your readout bottom left; Map, Add Route, Rides, Search and Radio Setup along the bottom. Every screen closes the same way — HELP and ✕ in the top right corner. *22–23 Oct*

What it means for you: one map to learn instead of two, and nothing hidden behind a second map.

NEW **The Map menu — every map tool in one place**

What is downloading (tap DETAILS for the queue) · the map source · download maps for offline use by area (draw a box) or along your tracks (all, or pick them, with a search by name) · remove maps · map recovery (your saved map recipes, refresh by source) · import trails by state or by area, import GPX, create trails from your tracks, resync tracks with their files. Choosing a tool closes the menu. *23 Oct*

What it means for you: the download and import tools that lived on the planning map are on the map you ride with.

NEW **The map type is a button on the map**

Map: SAT ▾ shows the map you are looking at; tap it to pick another. *23 Oct*

What it means for you: switching satellite and topo is one tap, and the button always says which you are on.

CHANGED **The map opens where you left it**

With internet, One Map opens on the view you last had; offline it opens on your cart; while recording it follows your cart. *23 Oct*

What it means for you: planning picks up where you stopped, and on the trail you start on yourself.

FIXED **Private land shows as private again**

Importing a large state could run out of memory at the step that decides public and private land, and the import still said it had completed — every trail then counted as public. The step now works through the trails in small pieces and says if it fails. If your trails all show as public, use **Map › Import map features › Assign Utah private property**. *23 Oct*

What it means for you: the private-land filter works again, and you can repair an earlier import without importing again.

NEW **Filter: off-grid maps on the map**

FILTER › OFF-GRID MAPS ☐ Available ☐ Downloading draws the areas you have downloaded, and the ones still downloading, on the map. *23 Oct*

What it means for you: you can see where your offline maps reach before you lose signal.

NEW **Area Search Radius works**

Choose how far in a place search zooms (Z12 to Z18); One Map's search uses it. It was saved before but never used. *23 Oct*

What it means for you: a place search lands at the zoom you want.

NEW Add Route on One Map — Build it myself

Add Route checks first for anything unfinished: a route left open when the app closed is loaded straight back in, and routes you were building are offered to continue. Then Build it myself: tap along the trails, each point snaps and saves as you go; Save, Discard, or ✕ to leave. *23 Oct*

What it means for you: you can plan a route on the map you ride with, and a crash never costs you the points you dropped.

NEW Add Route on One Map — AI route design

The guided steps: how far and how fast, your trailhead (with a search to find your area), a loop or a finish point, places you want to pass through, then FIND MY RIDES — and the comparison of the rides it builds, side by side in their own colours, fitted on the map. AI turns Trails and Waypoints on and keeps them on while it works; the comparison hides everything else and puts it all back when you leave. Nothing you left unfinished is deleted when you start. *23 Oct*

What it means for you: the AI planner works on One Map, and an earlier comparison waits for your decision instead of being cleared.

NEW One Search, Filter and Map Key

Search: one box searches trails, routes, tracks, waypoints and (online) places, scoped to a state you choose, with the result types as a filter. Filter: everything you show or hide, each trail type explained. Map Key: only what you are looking at, and the colour styles. *22 Oct*

What it means for you: one place to find something, one place to choose what shows, one place to read the map.

Earlier releases (2.7b, 2.7a and before) are in the app: MENU › Help › Release Notes.
