Version 2.5 — What's New

Field Test Release · Map Feature Update

"Life is too short. Enjoy your time on the trail. Never worry about a wrong turn."

About this release

V2.5 completes the free map product: trail and trailhead data you can download straight onto your maps, plus a single, consistent way to show and hide Trails, Tracks, Waypoints, and Routes on both the Convoy Map and the Planning Map.

This is a FIELD TEST build. A few rough edges are known and listed at the end — please read that section so expected behavior isn't mistaken for a fault. Your feedback on the new trail import and the artifact display is exactly what this round is for.

Headline: Import Utah Trails Onto Your Map

The big addition in V2.5 is the trail source catalog. You can now pull a full set of Utah trails — and their trailhead waypoints — directly onto your maps as artifacts, no files to copy and no internet needed once they're down. Here is exactly how:

How to import the UGRC Utah Trails

1. Open Work with Artifacts using the accordion button.
2. Select the Import Trails button. A list of trail sources will display.
3. Select the first item, UGRC Utah Trails.
4. Tap Validate/Confirm. The trails and their trailhead waypoints download to your maps as artifacts.
5. Fully close the app, then force close it, then reopen. The imported trails and trailheads will now appear. (The app loads its trail data at startup — a normal close and reopen, or a Force Stop from Android Settings → Apps → GroupTrack, ensures the new data is loaded.)

Once the import finishes and you have reopened the app, trails and trailhead waypoints are stored on your device and appear on both the Convoy Map and the Planning Map. They are part of your free map — no subscription, no connection required in the field.

Important — if your imported trails don't show

Two things to check, in order: (1) Fully close and reopen the app (or Force Stop it in Android Settings) so the new trail data loads. (2) Zoom in — trails display only when you are zoomed in close enough to use them. With about 49,000 Utah trails, nothing useful can be drawn when zoomed far out, so they appear as you zoom in to street/area level. This is intentional — see Known Issues.

What Else Is New in V2.5

FEATURE	DESCRIPTION
Trail source catalog	Browse trail sources and import them onto your maps. UGRC Utah Trails is the first source — about 49,000 trails plus 591 trailhead waypoints. More state and federal (BLM/USFS) sources are planned.

FEATURE	DESCRIPTION
One consistent artifact display	Trails, Tracks, Waypoints, and Routes now show and hide the same way on both maps through one shared process. Toggle a type ON/OFF or pick specific items — the map matches what the panel says.
Work with Artifacts panel	Open with the accordion button. Per-type ON / OFF / SELECTED control, with an item list for picking specific trails, tracks, or waypoints.
Default on launch	The map opens with Trails ON so you see the base trail layer immediately. Other types start OFF — turn on what you need.
RESYNC TRACKS	On the track import screen, RESYNC TRACKS rebuilds your track list from your saved GPX files — useful if a track is missing from the map.
Zoom readout	The compass indicator now shows the current zoom level (N · Z##) so you can see exactly how far in or out you are.
Standalone GPS / offline maps	Carried over from V2.4: live GPS without a radio connected, offline tile download, and online/offline switching all continue to work.

Requirements

REQUIREMENT	DETAIL
Android Device	Android 8.0 or later. Tablet recommended for best map visibility while riding.
Update method	Field test devices update automatically through the Play Store internal testing track. No APK to sideload.
Storage	500 MB+ free recommended for offline map tiles. Trail data itself is small (a full state is ~15–30 MB).
Meshtastic Radio	SenseCAP T1000-E (recommended) or any Meshtastic LoRa device on firmware 2.6+. Not required for trail/map use — only for convoy tracking.
Internet	Needed once to import trails and download tiles. Not needed in the field after that.

Known Issues — Please Read

This is a field test build. The following are known and being worked on — they are expected behavior for this round, not new faults. Reporting anything OUTSIDE this list is what helps most.

BEHAVIOR	WHAT TO KNOW
Trails/features not visible when zoomed far out	Expected. Features are hidden below a close zoom level because they aren't readable that far out and a partial set can mislead. Zoom in and they appear. A clean zoom cutoff is being finalized.
Selections look different after switching maps	Known. The two maps can currently share selection state, so what you picked on one map may carry to the other. A fix that gives each map its own independent, saved selections is the next major task.
Item list sometimes shows no names	Known. The Edit list in the artifact panel may come up empty even when items are on the map. Being addressed alongside the selection fix.
Don't import the same trails/tracks repeatedly	Important. Re-running an import can add duplicate copies (a check to prevent this is coming). Import the UGRC source ONCE. If something looks off, use RESYNC TRACKS rather than re-importing.
Tracks missing after an update	Open the track import screen and tap RESYNC TRACKS to rebuild from your saved files.

Troubleshooting

PROBLEM	SOLUTION
Imported trails don't appear	Zoom in — trails show at closer zoom levels. Confirm the import finished (you'll see trailhead waypoints too).
No vehicles on map (convoy)	Check the radio is connected (green status). Verify all radios use the same channel name and PSK.
Map tiles blank offline	No tiles downloaded for this area. Download tiles while online before heading out.
Map tiles not loading online	Check your internet connection — online connection is required to stream or first-download tiles.
A saved track is missing	Track import screen → RESYNC TRACKS.
Something not on this list	Please report it — that's the kind of feedback this field test needs. Note

PROBLEM	SOLUTION
	what you tapped and what you expected.

Thank you for field testing V2.5. The trail import and the new artifact display are the focus this round — try importing the Utah trails, toggle types on and off on both maps, and let the organizer know how it goes.
