

GroupTrack V2.4

Release Notes · May 2026

Now Free for Solo Riders

GroupTrack is now free for solo riders. Use the app as a standalone offline GPS tracker — no Meshtastic radio required. All map features, track recording, trail overlays, and track file management are fully available. When you're ready to ride with a group, add a Meshtastic radio and the convoy features unlock automatically.

What's New

Work With Tracks

A full-screen track manager replaces the previous export sheet. Search by filename, sort by date or name, and filter by All / Saved / In-Progress. Per-track actions:

- **Fix Creation Date** — rewrites a track file's date to match its earliest GPS timestamp. Useful for imported files from Gaia, onX, or older devices that show today's date instead of when the ride actually happened.
- **Rename** — change the track name; sort updates instantly.
- **Delete** — confirmed before removing.
- **Copy to Downloads** — for sharing via cloud or USB.
- **Share** — send via email, messaging, or any installed app.

Map and Recording

- **autoPan** — map automatically follows your position while recording, returns to manual panning when stopped.
- **Immediate centering** — when you tap RECORD, the map snaps to your cart with no 1–3 second delay.
- **Smooth sleep handling** — phone sleeps, recording auto-pauses, radio disconnects cleanly. Phone wakes, radio reconnects, recording resumes.
- **Async track loading** — opening track files no longer freezes the UI when you have many tracks.

Identity Lock at RECORD

When you tap RECORD, GroupTrack locks the current GPS source and identity for the entire ride session. If a radio is connected, its GPS and node ID are used. If no radio is connected, the phone's GPS and "My Cart" identity are used. Identity does not change mid-ride, even if the radio disconnects, reconnects, or you switch to a different radio.

Lead Cart Selection (Multi-Radio Convoys)

When multiple radios are detected at RECORD, a dialog appears asking which radio is the lead cart. The lead cart's recorded track is displayed to all other carts as the route to follow.

Stability

- Fresh-install ANRs eliminated (storage permission flow, phone GPS in tick loop)
- All-files storage permission dialog now appears at convoy screen open instead of app launch
- Phone-only GPS mode works without any radio paired

- Permission re-prompt on app resume if location was revoked while in background

Known Limitations (V2.4)

Limitation	Details
No mileage display	Trip distance / odometer is not displayed. Planned for a future release.
60s speed warmup	Speed shows 0 mph for the first ~60 seconds while GPS acquires enough samples.
GPS interval 3s	Track points are recorded every 3 seconds. Higher resolution planned for V2.5.
Budget device BLE	Low-cost tablets (Tab8NEU and similar) cannot hold BLE connection to T1000-E radios. Use a name-brand Android phone.

Coming in V2.5

- Track display selector on convoy and Map Viewer screens extended to include in-progress files (renameable directly from the selector)
- Standalone product polish — full feature parity with Gaia GPS and onX for solo riders
- Higher-resolution GPS recording (1-second interval option)
- Trail catalog expansion — national coverage rather than Utah-only
- Unified GeoPackage architecture (replaces 22 MB Utah GeoJSON)

Upgrade Notes

V2.4 testers: install over your existing version. Your tracks, downloaded maps, and radio settings are preserved.

Switching from sideloaded APK to Play Store: uninstall the sideloaded version first (different signing key). All track files and tile cache will survive the uninstall — they live in shared storage at `/sdcard/Documents/GroupTrack/`.

Solo riders: install and open the app. Skip the radio connection step in the user manual. The app records your GPS, displays the map, and saves tracks immediately.
